

More grip,  
whatever the conditions

# The power of specialisation

Zuidberg is a leading, family-run company that has been active worldwide since 1982. The Engineering, Production, Sales and After-Sales business units are all housed at a single location. This arrangement makes optimal use of knowledge and experience to maintain the leading position in the world market for front linkage systems, transmission systems and track systems. The mutual cooperation that exists between our business units gives products from Zuidberg a distinctive quality all of their own.

Zuidberg's products meet both the most stringent quality standards and the exacting demands of its customers. Zuidberg is one of the most specialized production companies in the agricultural sector. Consistent quality is maintained thanks to the fully-automated production process. Innovation, combined with the fact that the company specialises in the very latest computer-controlled production, has enabled it to develop a competitive edge within the market.

## At Zuidberg Tracks B.V. you can count on:

- › A product that is custom-built - the tracks are fully adapted to the vehicle.
- › Fitting instructions, user manuals and safety instructions are supplied with every products.
- › A skilled service team on hand to answer questions and offer solutions.
- › A warranty policy which covers the products, parts and labour.
- › Integrated development in OEM systems. Zuidberg products have been extensively tested and comply with the highest quality standards.
- › A properly functioning Internet Dealer Portal. Zuidberg customers can access the Trac-Online system via [www.zuidbergtracks.com](http://www.zuidbergtracks.com). Information about price lists, parts lists, drawings and assembly instructions are available to our customers.
- › Extensive product range. Zuidberg Tracks B.V. supplies track systems for almost every type of tractor or harvester.
- › A comprehensive range of accessories and an efficient spare parts service.

**ZUIDBERG**  
TRACKS

**ZUIDBERG**  
**WESTTRACK**

- Up to 75% less ground pressure than wheeled machines
- Minimise soil compaction, maintain soil structure
- Increased contact surface area for optimum traction.
- Interchangeable with standard wheels
- Simple to fit and remove

# Turn your machine into a tracked vehicle

With the rubber tracks from Zuidberg-Westtrack, converting your tractor or machine into a powerful and flexible tracked vehicle is easy. With the Zuidberg Westtrack system, you can work your land under extreme conditions. The triangular systems allow you to drive across any type of surface - wet or dry, flat or undulating - with ease. Zuidberg Westtrack systems allow you to drive over surfaces with a lower load-bearing capacity earlier in the year and do so for longer, meaning you can extend your working season. By design, the tracks exert a lower ground pressure and as a result damage to the soil structure is dramatically reduced.

„You can also work in wet conditions”

## Proven Zuidberg quality

Mechanized solutions for use in agriculture, horticulture and forestry have been developed in order to enhance efficiency and increase capacity. Tractors and machines are becoming bigger and bigger in both size and weight. When the ground is wet, machines are often no longer capable of moving or working. Additionally, the quality of the soil decreases as a result of the high ground pressure. Zuidberg Tracks B.V. provides a solution to this - the Zuidberg-Westtrack rubber track systems. The latest generation of tracks to provide the tried-and-trusted Zuidberg quality.

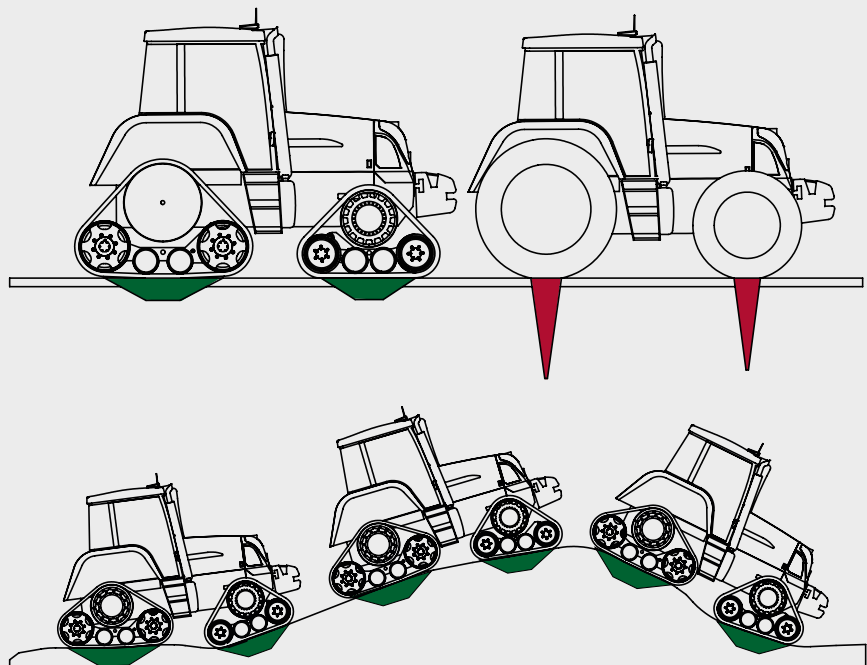

## Various systems are available

The rubber tracks are especially suited to applications in agriculture, horticulture and earth-moving. Depending on the weight of your tractor or machine and its application, you can choose from a variety of track systems from Zuidberg-Westtrack.

The triangular systems can be fitted to almost any tractor, self-propelled or towed machinery and agricultural vehicles. Track systems from Zuidberg-Westtrack can also be custom-built to your specific requirements in relation to track width, rut width, wheelbase, wheel height and load.

## Reduced ground pressure, greater yield

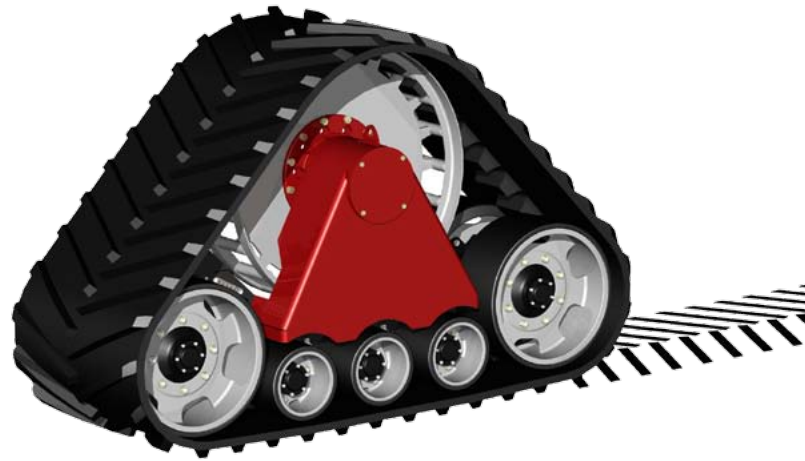

A track system can reduce the ground pressure by up to 75% compared to machinery using standard tyres. The structure of the soil in which you are sowing, planting or setting therefore remains fully intact. This means that the growth of the crops is unaffected, improving both the quality and the quantity of yields. Even when crossing obstacles, the tracks will adopt the optimum position, based upon the ground pressure.

„The soil structure is kept more effectively intact”

## Tracks for improved grip

Using the Zuidberg-Westtrack track systems increases the towing and/or load-bearing capacity of your machine on the soil, due to the fact that the contact surface on the ground is many times greater than with a normal pneumatic tyre. When using a rubber track, up to four times as many grooves are active on the ground. In addition, the self-cleaning ability of the rubber track means that the track does not clog-up, so you can be sure you will achieve optimum traction. All Zuidberg Westtrack track units generate full traction with the ground, even when negotiating bends.

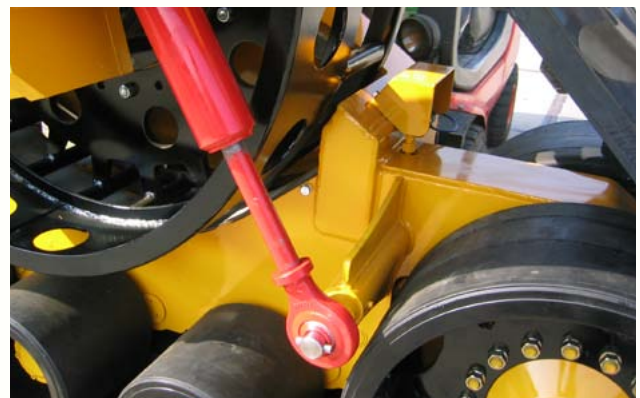

## Easily interchangeable

Fitting and removal are simplicity itself. You can change the standard wheels on a tractor or machine for track units in a very short period of time. This does not require any major modifications to the machine. If desired, the machine can quickly be put back into use with the standard wheels so that the original utility value of the machine is retained.

## Options and accessories

› Automatic lubrication system

› Limiter set

› Track wideners

› Adaptors
